Project, Presentation and Viva Guidelines

1. Project Guidelines

1. Each group can have minimum 3 members and maximum 5 members.
2. The project must demonstrate the application of appropriate data analytics techniques to address the selected business problem.
3. The project should include data understanding and cleaning, descriptive analysis, suitable visualisations, an appropriate analytical method, interpretation of findings, and business recommendations.
4. Groups must submit their project report, dataset, and working code/notebook by the announced deadline.
5. The report should clearly explain the business problem, methodology, key findings, recommendations, and limitations of the analysis.
6. Visualisations must be relevant to the business problem and supported by meaningful interpretations. Charts should not be included merely for decoration.
7. Every group member is responsible for understanding the complete project, including the data, analytical methods, results, and recommendations.

2. Use of AI Tools

1. Students are permitted to use AI tools for coding assistance, debugging, understanding concepts, and improving the presentation of their work.
2. Students must verify the correctness of AI-generated code, calculations, visualisations, and analytical results.
3. Students must be able to explain the purpose of the code, the methods used, and the meaning of the results during the viva.
4. AI-generated outputs must not be accepted without checking their accuracy and relevance to the business problem.
5. Marks will be awarded on the basis of the quality of the analysis, correctness of the results, interpretation, and demonstrated understanding—not merely on the appearance or length of the submitted work.

3. Presentation Guidelines

1. Each group must present its business problem, analytical approach, key findings, visualisations, and recommendations.
2. The presentation should focus on the business insights obtained from the analysis rather than simply displaying code or reading from slides.
3. Every group member must participate in the presentation and be prepared to answer questions about the project.
4. Presentation duration and schedule will be communicated by the instructor.

4. Individual Viva

1. Every student will undergo an individual viva as part of the group project assessment.
2. Questions may cover data cleaning, descriptive analysis, visualisation, regression, machine learning, fraud detection, business storytelling, and the group's own project.
3. Students may be asked to explain a code cell, interpret an output, justify an analytical decision, identify a limitation, or suggest an improvement.
4. Individual viva marks will depend on the student's own understanding and responses, not on the performance of other group members.
5. Students who are unable to explain the methods and findings of their submitted project may receive lower individual marks, even if the group's overall submission is of high quality.

5. Submission and Deadline

1. Each group must submit all required project files by the announced deadline.
2. Students are responsible for ensuring that their files open correctly and that the submitted code and outputs are accessible.
3. Late submissions will be handled according to the announced deadline and applicable university policy.
4. Presentation and viva schedules must be followed as communicated by the instructor.

Important: The objective of this assessment is to evaluate students' ability to apply data analytics to business problems, interpret results, communicate insights, and make evidence-based recommendations. Students are encouraged to use AI responsibly, but they must take ownership of the work they submit.
